

# **Creating a Template in Word with SQL Data**

## **Training Guide**

#### Welcome to Windward Designer

Windward Studios takes a unique approach to reporting. Our Report Designer sits directly inside Microsoft Office which means you get to use a **familiar and powerful tool** without having to learn a new designer. If you've ever used one of our competitors' products, you may be familiar with their modular designers that require you to build reports using bits and pieces, where every bit of text or every piece of data is a distinct object in your template. Windward changes all of that. With Windward in Microsoft Office, you **design report templates just like you design any other document**, utilizing Tags to insert your data wherever you need it seamlessly in-line with your other text and content.

#### **Training Overview**

This Training Guide walks you through the fundamental steps you need to begin designing templates with Windward Designer in Microsoft Word using a SQL Datasource.

The Four Steps to Windward:

- 1. <u>Install</u>
- 2. <u>Connect to data</u>
- 3. Design your template & insert your data
- 4. <u>Output</u>

#### Step 1 - Install

To get started, you need to install the Designer. If you have it already installed, please skip this step!

If you already have a license key, please visit the <u>downloads page</u> to install the software.

Or start a free 14-day trial!

### Step 2 - Connect To Data

In this training guide, you are connecting to a sample SQL Datasource provided by Windward.

#### To connect to the sample data:

1. Open Microsoft Word. Now that you've installed Windward Designer, you will see two new tabs in the Microsoft Office Ribbon – the **"Windward"** Tab and the **"Windward Tools**" Tab.

2. Click on the **"Windward Tab"** and click on the **"Data Sources"** button located on the lefthand side of the ribbon. This opens the Connection Editor where you will manage all of your data connections. (Alternatively, you can click on the lower half of the button to expand the drop down and then click **"Data Sources."**)

Datasource connection succeeded		

#### Step 3 - Design Your Template & Insert Your Data

In this training guide, you will build a very basic template to get the feel of Windward Designer. While your final product may not seem very impressive, you will learn the basic skills to making any template! You will make a template which will output the product name and unit price for every product in the sample data, with each product separated by a line.

In situations where you want to output many records returned from a select, you can use a ForEach tag. The ForEach tag will generate output once for each record returned by its select. The ForEach tag itself will not insert data into the template, but rather stores data in a variable that can be used by other tags to generate output.

1. To place a ForEach tag, expand the drop down under the button "**Tags**" in the Windward ribbon and click "**ForEach**."

AutoSave 💿 🗊 🚍 ちょび 🕫	Document1 - Word	Cassie Hottenstein 🖻 — 🗆 🗙

Data Data POD Input Tag Sources Bin Bin Parameters Tree Data	Tags Delete Tag   Delete Tag   Delete Tag   Edit Tag   Edit Tag   Equation   Cout   Equation   Cout   End ForEach   End ForEach   Else   End Switch   Switch   Case   End Switch   End Link   Chart	Output Help

2. Click enter to move to a new line, expand the drop down under the button "**Tags**" in the Windward ribbon, and click "**EndForEach**" to place a closing tag for the ForEach tag.

Now all of the content that you place between the ForEach and EndForEach tags will be generated once for each record returned by the ForEach tag's select.

3. For the ForEach tag, you will select the Product table so that you can output information on each product. You can use the Tag Editor to easily create a query for your tag. Place your cursor on the **"[forEach:]"** tag that was inserted in your template and click the **"Edit Tag"** button in the Windward ribbon to open the Tag Editor.

					[Product Product Unit Pric	Name: :e:													

The "Product Name" and "Unit Price" text will be output for every product returned by your ForEach tag's select.

Out tags will be used to insert data into your final report. These tags will output the Product Name and Unit Price for each product after these labels.

7. Place your cursor after the "Product Name:" text, and click "**Tags**" in the Windward ribbon and click "**Out**." This places an Out tag at the location of the cursor.

8. Open the tag Editor by placing your cursor on the Out tag and clicking "Edit Tag."

	Results		< >
tag is valid			.4

15. Finally, you are going to add some indicator between each product so you can easily distinguish between them in your output. Indent to a new line after the line starting with "UnitPrice:"

16. Add a horizontal line by typing "---" and pressing **Enter**. This will create a line across the document followed by an indentation.
